Olha Razvaliaieva | **Backend Engineer | PHP, Go, Symfony, Microservices**

Kyiv, Ukraine (Open to US/EU Remote) | B2B Independent Contractor
olharazvaliaieva@gmail.com | +380661801616 | Linkedin | GitHub

Summary

Backend Engineer with 5+ years of experience building high-load architectures for 150M+ users. I design and maintain resilient backend systems, from greenfield microservices to legacy migrations, using PHP/Symfony and Go. I enforce Domain-Driven Design (DDD) and strict code quality (85%+ test coverage). My background in Product Management allows me to translate complex business requirements into clean, resilient technical execution.

Skills

- **Languages:** Go (Golang), PHP (7.x - 8.x).
- **Architecture:** Domain-Driven Design (DDD), Microservices, CQRS, Hexagonal Architecture, RESTful API Design.
- **Databases & Messaging:** PostgreSQL, MySQL (Schema Design, Query Optimization), Redis, RabbitMQ.
- **Infrastructure & DevOps:** Docker, Docker Compose, Kubernetes (K8s) context, CI/CD Pipelines, Linux.
- **Testing & Observability:** PHPUnit, Test-Driven Development (TDD), Integration Testing, New Relic, Postman.
- **Spoken Languages:** English - full professional proficiency, Ukrainian - Native.

Experience

Backend Engineer
Digital Sports Media | May, 2024 - present
I scale microservices for a 150M+ user global media platform across 30+ countries, while also optimizing a high-load internal CRM supporting 600+ DAU.

- **Legacy Migration:** Decoupled a legacy monolithic system into 3 independent microservices. Migrated core functionality from PHP 7.4/Symfony 4.4 to PHP 8.4/Symfony 7.3 and Docker, eliminating legacy infrastructure costs.
- **Go Microservices:** Developed production-ready backend features and bug fixes for high-traffic services using Go (Golang) within a distributed architecture, ensuring continuous system stability.
- **Performance Optimization:** Wrote a highly optimized Symfony console command with efficient database querying that accelerated internal data extraction workflows by 99% (reducing processing time from hours to <44 seconds for 22,100+ URLs).
- **BFF Performance Optimization:** Profiled the BFF microservice with New Relic APM and implemented a granular Redis caching strategy with staggered TTLs and proactive cron warming. This reduced peak response times by ~47% (from 150ms to <80ms), eliminated traffic spikes, and achieved a 0.99 Apdex score.
- **Architecture:** Designed and owned a Symfony Polls/Quizzes microservice (~11,200 users) built with DDD, CQRS, and Hexagonal architecture; later the team standard.

Evolved it from multilingual voting into scored/opinion quizzes with campaign analytics and backend result privacy, keeping poll clients backward-compatible.
- **Universal Versioning Architecture** (implementation in progress): Authored the end-to-end technical design for a service-agnostic audit history platform after researching three interconnected services. Designed reliable at-least-once event delivery with Transactional Outbox, RabbitMQ, Redis-coordinated idempotency, and ClickHouse, enabling searchable entity change history, backward-compatible migration, and faster onboarding of new product domains.
- **Cross-Functional Impact:** Standardized API documentation in Confluence. This reduced QA testing time from 3 days to 1 day and cut frontend integration time from 19 hours down to 4.5 hours.
- **Code Quality:** Enforced a strict 85%+ test coverage policy (PHPUnit) across backend services, reducing post-release production bugs by approximately 32%.

Tech Stack: PHP 7-8, Go (Golang), Symfony 6-8, PostgreSQL/MySQL, Redis, ClickHouse, RabbitMQ, Docker, PHPUnit, Agentic Engineering.

Software Engineer (Full-Stack)
ScrumLaunch | Nov 2021 - Feb 2024
Engineered and scaled multi-tenant SaaS platforms for US-based enterprise clients and startups. While I operated across the full stack, my highest impact was on backend architecture, API design, and system resilience.

- **Client Communication & Engineering Ownership:** Acted as the primary technical point of contact for US-based stakeholders. Directly negotiated new feature requirements, proposed architectural solutions, and managed release planning and legacy support.
- **Integrations:** Integrated the Stripe API and designed backend payment workflows to enable secure subscription management for a distributed application serving 8,700+ users.
- **System Architecture:** Co-designed RESTful API contracts and optimized JSON payloads. Engineered data-fetching strategies that eliminated server bottlenecks and reduced database load during peak traffic.
- **State Management:** Architected backend synchronization mechanisms using Message Queues (Pub/Sub) and strict SOLID principles to ensure 100% data consistency across distributed client applications.
- **Troubleshooting:** Traced API logs, profiled databases, and resolved complex edge cases, directly accelerating issue resolution for 12+ enterprise clients.

Tech Stack: PHP 7-8, MySQL, Stripe API, RESTful APIs, Message Queues.

Software Engineer
EPAM Systems | Jun 2021 - Oct 2021
A global provider of software engineering and digital transformation services.

Results & Achievements:
● Established a maintainable codebase for a large-scale delivery ecosystem (admin and client apps) by implementing strict MVC and Observer design patterns.

● Integrated Firebase for real-time data flow and optimized SPA routing, enabling instant data synchronization across distributed applications.

Product Manager & Lead Designer
Private Manufacturing Enterprise | 2016 - 2020
A large-scale B2B apparel manufacturing company exporting internationally.
Responsibilities: Led product development, cross-functional team workflows, global market research, and B2B client relations.

Results & Achievements:
● **Drove a 3x increase in company revenue** within 18 months (selling 20,000+ units annually) by analyzing market trends and designing product lines with a highly validated Product-Market Fit.
● **Ensured strict quality control and continuous on-time delivery** by orchestrating complex cross-functional workflows and production cycles for 84-107 internal staff and external facilities.
● **Maintained high production profitability and margins** by acting as the primary technical and business negotiator for wholesale B2B clients, strategically balancing their feature requests with actual production capabilities.

Education
Master's Degree in Computer Engineering
Kharkiv National University of Radioelectronics | 2023
Specialty: System Programming
Advanced engineering focus on low-level system design, artificial intelligence, and high-performance computing (HPC).
Key Coursework: Programming of Embedded Systems, OS/Driver Development, Machine Learning, Parallel Modeling, GPU Computing, and Resilient Network Architectures.

Bachelor's Degree in Computer Engineering
Kharkiv National University of Radioelectronics
A rigorous engineering foundation bridging the gap between software and hardware.
Key Coursework: Computer Architecture, Microcontrollers, Hardware Description Languages (HDL), Control Systems, Information Security, Discrete Mathematics.

Volunteering / Mentorship:
● **Software Engineering Mentor** | Vona Tech Community & INSCIENCE | 2025 – 2026

Mentored 9+ junior developers (including women transitioning into tech) through 1:1 technical coaching, code reviews, mock interviews, and career roadmapping to successfully accelerate their transition to Middle roles.

Certifications: Platform Architecture AI edition (Fwdays), Architecture as Code (Fwdays), Microservice Architecture (Fwdays), Clean Code & Design Patterns (Robot_Dreams).
